Chapter 1

General Ledger.

General Ledger will be a fully-featured, multi-user, open-source general ledger system. The project is in the early stages of development.

Chapter 2

Todo List

File gluser_pass.cpp

Implement a better form of password encryption. In particular, these functions are not re-entrant, and only use the first 8 characters of the password.

Chapter 3

Bug List

Member gldb::Table::Table (const Table &table)

‘explicit‘ removed from here after failure to compile at end of MySQL query function.

8.2.1 Detailed Description

Module for interacting with the database.

8.2.2 Function Documentation

8.2.2.1 DBConnImp * gldb::get_connection (const std::string & *database,* const std::string & *hostname,* const std::string & *username,* const std::string & *password*)

Creates and returns a pointer to a database implementation.

The implementation of this function is provided by the individual database implementations. One database implementation is compiled into the program at any one time. Multiple database systems are, or will be, supported, and not every system will possess the libraries and headers to compile every implementation. Therefore, only only implementation is compiled in at a time. The fact that each database implementation will implement this function to return the correct derived class prevents any attempt to compile unsupported library code. This would not be feasible if we were to simply provide each implementation as a subclass.

Parameters

database	The name of the database to which to connect.
hostname	The hostname of the computer running the database.
username	The username with which to log into the database.
password	The password with which to log into the database.

Returns

A pointer to the database implementation.

8.2.2.2 std::string gldb::get_database_type ( )

Returns the name of the compiled-in database type.

Returns

The name of the compiled-in database type.

8.2.2.3 static TableRow get_field_names (MySQLResult & *result*) [static]

Gets field names from a MySQL result structure.

Parameters

result	The MySQL result structure.

Returns

A TableRow containing the field names.

8.2.2.4 static TableRow get_row (MySQLResult & *result,* MYSQL_ROW *row*) [static]

Creates a TableRow from a MySQL result row.

Parameters

result	The MySQL result structure.
row	The MySQL row structure.

Returns

A TableRow containing the row data.

8.4.2 Function Documentation

8.4.2.1 std::string genleg::decorated_report_from_table (const gldb::Table & *table*)

A "decorated report" presents the table surrounding with ASCII-art style lines consisting of '+' , '−' and '|' characters.

Parameters

table	The table from which to create the report.

Returns

A string containing the report.

8.4.2.2 static std::string decorated_row (const TableRow & *row,* const std::vector< size_t > & *widths*) [static]

A string containing the decorated row.

8.4.2.3 static void grow_widths (std::vector< size_t > & *widths,* const TableRow & *row*) [static]

Increments a vector of required column widths.

Each element of the vector is increased to fit the width of each file in the row, if the existing width is not large enough to contain it.

Parameters

widths	An existing vector of widths.
row	The row against which to check and potentially increase the vector.

8.4.2.4 static std::vector< size_t > max_column_widths (const gldb::Table & *table*) [static]

A vector of size_t containing the maximum required width for each column, without padding.

8.4.2.5 std::string genleg::plain_report_from_table (const gldb::Table & *table*)

Creates a plain report from a table.

A "plain report" separates each column with a space.

Parameters

table	The table from which to create the report.

Parameters

row	The row for which to create the report row.
widths	A vector of required widths.

Returns

A string containing the plain row.

8.4.2.7 static std::string separator_row (const std::vector< size_t > & *widths*) [static]

Returns a decorated separator row for a table.

The "separator row" is of the format "+—+—+—+" where each column is separated by a '+' character, and consists of enough '-' characters to fit the respective width in the vector plus two additional characters for spacing.

Parameters

widths	A vector of required widths.

Returns

A string containing the separator row.
